

Manual RS-Logon

After starting the program the PIN is required.

The default PIN is „12345678“.

It is strongly recommended that you change the PIN.

On the screen the RS-Logon window comes up:

RS-Logon

Rev 2.1.46 powered by RSC SN: 99093317120411EA

Several accounts can be inserted. Following settings are possible:

Username / Password -> Fill in username and password of your personal Windows account

Domain -> If your computer is part of a domain you have to name it here.

Hint -> For security reasons the name of the domain is not shown later on.

Lock Account -> This feature saves the active account from unauthorized access.

Default -> If you stored several accounts on the token, this setting will offer the active account first for Windows logon.

Establish Connection -> If you need a VPN connection immediately after Windows logon, choose the VPN connection and insert username and password into the appropriate fields.

The VPN connection has to be installed on the system, only the sensitive data will be devolved from the token.

2-way Authentication -> The two-way-authentication is switched on. For Windows logon your token and PIN are required.

Lock with Screensaver -> RS-Logon will lock your account when the screensaver of your computer comes up.

RS-Token removal behavior -> This handles the token removal behavior

- no action >
- lock workstation >
- shutdown >
- force logoff > User log off

Change PIN -> The PIN of your token can be changed, not the password.

Save -> Saves the accounts on the token.

Enter -> If you locked an account, you can unlock it with the right password.

Exit ->

Clear Account -> To remove an account from the token, clear the username and click the save button.

System environment:

Windows Vista 32/64 Bit

Windows7 32/64 Bit

Windows Server 2008, 2008 R2, 2011

Token with RS-Logon brand (ePass2003, ePass3003, StorePass2001, MicroSD chip card, PKI smartcard and more..)
